mhanley@hfzlaw.com
docketing@hfzlaw.com

Continuation of Disposition of Claims: Claims pending in the application are 1,4,5,7,9-11,16-18,20-29,31-33,37-39,42,60,61,63,65,72,74,76,78,80-82,95,102 and 107-112.

Continuation of Disposition of Claims: Claims rejected are 1,4,5,7,9-11,16-18,20-29,31-33,37-39,42,60,61,63,65,72,74,76,78,80-82,95,102 and 107-112.

DETAILED ACTION

1. This Office action is made in reply to Response to the Office Action Dated June 9, 2009 ("Reply"), filed September 28, 2009. Applicant has amended Claims 1, 7, 10, 17, 21, 26, 60, 72, 74, 76, 78, 80, 82, 95, 102 and 107-112; no claims have been added; and no claims have been cancelled. As amended, Claims 1, 4, 5, 7, 9-11, 16-18, 20-29, 31-33, 37-39, 42, 60, 61, 63, 65, 72, 74, 76, 78, 80-82, 95, 102 and 107-112 are presented for examination.

2. In Office action mailed June 9, 2009 ("Office Action"):

Claims 1, 4, 5, 7, 9-11, 16-18, 20-29, 31-33, 37-39, and 42 were rejected under 35 U.S.C. 101 as not falling within one of the four statutory categories of invention.

Claim 1 was provisionally rejected on the ground of nonstatutory obviousness-type double patenting as being unpatentable over Claim 1 of copending Application No. 11/550,261.

Claims 1, 4, 5, 7, 9-11, 16-18, 20-29, 31-33, 37-39, 42, 60, 61, 63, 65, 72, 74, 76, 78, 80-82, 95, 102 and 107-112 were rejected under 35 U.S.C. 103(a) as being unpatentable over Aras et al. United States Patent (5,872,588), in view of Link et al. United States Patent (6,289,514 B1).

Response to Arguments

3. Applicant's arguments, see Reply Pages 16-21, with respect to Claims 1, 60, and 72, have been fully considered but they are not persuasive.

4. Applicant presents that the combination of Aras and Link fails to teach or suggest “combining the subscriber metering data and server metering data to monitor the VOD content provided specifically to the first subscriber site” because “Link’s asset tag timestamp records contain timestamped asset codes for audio/video content broadcast generally to all consumers served by the head end 301” (Reply Pages 16-17; with further reference to Link Col. 6 Lines 18-40). Applicant additionally presents that “the virtual channel numbers and published schedule database of Link also do not qualify as the recited server metering data because they neither identify VOD content provided specifically to a first subscriber site nor identify the first subscriber site to which the VOD content was provided” (Reply Pages 17-18; with further reference to Link Col. 10 Line 12—Col. 11 Line 20). The Examiner respectfully disagrees.

The Examiner submits that Applicant is separately addressing the references of record and is not considering the teachings in combination as established in the previous Office action. As previously presented in Office Action Pages 5-6, Aras teaches a method to monitor exposure to selected VOD content, where the method includes determining server metering data and determining subscriber metering data. As stated in Office Action Page 6, “Aras is unclear if the BCC 121 performs the step of combining the subscriber metering data and the server metering data to monitor the selected VOD content provided to the subscriber site.” The Examiner emphasizes that Aras, and not Link, is cited as teaching monitoring user interaction with VOD content by way of server and subscriber data. Link provides a teaching of combining the subscriber metering data and the server metering data using Asset Viewer Ship

Art Unit: 2427

Consolidator 214 in accordance with the method of Figure 8 (as presented in Office Action Page 6).

The Examiner submits that Aras teaches the amended providing “VOD content specifically to a first subscriber site in a plurality of subscriber sites” by way of AVI Distribution Extension Fields (AVI-ED) included in the program stream by content and network providers, where the AVI-ED can be used to identify the zip code of a local distribution node (as described in Col. 9 Line 17—Col. 10 Line 8; with further reference to Table III in Col. 10). Aras additionally discloses that when this information is collected, it can be used to specifically target specified subscribers or groups of subscribers (Col. 13 Lines 7-23). Therefore it is the Examiner's position that the combination of Aras and Link does in fact teach the limitation of Claim 1, as presented below.

5. In regards to Claims 60 and 72, Applicant presents that the combination of Aras and Link does not teach or suggest “subscriber metering data indicating whether VOD content was selected for presentation at the first subscriber site but not identifying the VOD content, and the server metering data identifying the VOD content provided by the VOD server specifically to the first subscriber site and also identifying the first subscriber site” (Reply Pages 19-21). Applicant additionally presents that the combination of Aras and Link does not teach or suggest the Claim 72 limitation “a central facility to combine the subscriber metering data and the server metering data by replacing first metering data included in the subscriber metering data with second

Art Unit: 2427

metering data included in the server metering data” (Reply Page 20-21). The Examiner respectfully disagrees.

It is the Examiner’s position that Link demonstrates this limitation by way of Asset Consolidator Process 214 of Figure 8. In particular, Link discloses that during the consolidation process, if program information is missing from the aggregated subscriber data then from the head end records is used to update the Viewership Consolidated Database 114 (as described in Col. 10 Line 43—Col. 11 Line 43). The Examiner also notes that Link’s process of Figure 8 includes the act of replacing subscriber metering data with server metering data by way of the updating process using elements 110-112 (as described in Col. 10 Line 43—Col. 11 Line 43). Therefore the Examiner submits that the combination of Aras and Link discloses the limitations of Claims 60 and 72, as presented below.

Claim Rejections - 35 USC § 101

6. Applicant has amended Claim 1 to positively recite “a server metering device” and “a VOD server” performing the claimed method. In view of this amendment, the rejection of Claims 1, 4, 5, 7, 9-11, 16-18, 20-29, 31-33, 37-39, and 42 under 35 U.S.C. 101 is withdrawn.

Double Patenting

7. Applicant's amendments to Claim 1 the instant application and Claim 1 of copending Application Number (11/550,261) provide patentably distinct subject matter. Therefore, the rejection on the grounds of nonstatutory obviousness-type double patenting as being unpatentable over Claim 1 of copending Application No. 11/550,261 is withdrawn.

Claim Rejections - 35 USC § 103

8. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

9. Claims 1, 4, 5, 7, 9-11, 16-18, 20-29, 31-33, 37-39, 42, 60, 61, 63, 65, 72, 74, 76, 78, 80-82, 95, 102 and 107-112 are rejected under 35 U.S.C. 103(a) as being unpatentable over Aras et al. United States Patent (5,872,588) hereinafter "Aras", in view of Link et al. United States Patent (6,289,514 B1) hereinafter "Link".

10. In regards to Claim 1, Aras teaches a method to monitor presentation of video-on-demand (VOD) content (collection of data on behavior of subscribers to audio-visual materials such as VOD content, as introduced in Col. 6 Lines 32-54 and Col. 13 Line 24—Col. 14 Line 24; with further reference to Fig. 6, as introduced in Col. 14 Lines 25-43 and Col. 12 Lines 39-54), the method comprising:

determining server metering data using a server metering device in communication with a VOD server (ITV Server 103 of Fig. 4A, as described in Col. 13 Lines 7-23, in communication with Monitor 1555 of Home Station 111, as introduced in Fig. 15 and Col. 25 Lines 7-17), the VOD server configured to provide the VOD content specifically to a first subscriber site in a plurality of subscriber sites (Audio-Visual Identifiers (AVIs), as introduced in Col. 7 Lines 31-67; with further reference to Content and Network related Extension Fields of Tables II and III, identifying information such as zip code of local distribution node, as described in Col. 9 Line 17—Col. 10 Line 7);

determining subscriber metering data corresponding to media content presented at the first subscriber site using a site metering device (“Behavior Collection & Reporting”, as introduced in Col. 13 Line 24—Col. 14 Lines 24 and shown in Fig. 6(i), as described in Col. 17 Line 23—Col. 18 Line 9; with further reference to Behavior Collection Table (BCT), as introduced in Col. 20 Lines 15-33 and shown in Figs. 10-13); and

the subscriber metering data indicating whether the VOD content was selected for presentation at the first subscriber site (VOD navigation operations such as pause, rewind, slomo, and fast forward, as disclosed in Col. 23 Lines 27-38), and

the server metering data identifying the VOD content provided by the VOD server specifically to the first subscriber site (AVI Content Extensions Fields (AVI-EC) including information such as Content Type and Application Category, as shown in Table II of Col. 10 and described in Col. 9 Line 17—Col. 10 Line 8) and also identifying the first subscriber site (AVI Distribution Extension Fields (AVI-ED) included in the program

Art Unit: 2427

stream by content and network providers, where the AVI-ED can be used to identify the zip code of a local distribution node, as described in Col. 9 Line 17—Col. 10 Line 8, Col. 13 Lines 7-23; with further reference to Table III in Col. 10).

Aras describes a method performed by Behavior Collection Center (BCC) 121 of Fig. 4a for taking information collected by various home stations and processing it for various marketing, broadcast planning, advertising, and Audio-Video Material (AVM) provider organizations (as disclosed in Col. 12 Lines 51-54). Aras additionally discloses in Col. 13 Lines 7-23 that the BCC 121 will collect, collate, analyze, and process the information so that it can be provided to various advertising agencies, marketing agencies, and AV material. However, Aras is unclear if the BCC 121 performs the step a of electronically combining the subscriber metering data and the server metering data to monitor the VOD content provided specifically to the first subscriber site.

In a similar field of invention, Link discloses a system and method for capturing and reporting consumer behaviors concerning television use (Abstract, Fig. 1, and Fig. 8). Link discloses the use of Asset Code Server 202 of Fig. 1A for assigning a range of codes to an entity, such as a company or organization (as discussed in Col. 5 Lines 23-31). Link further discloses monitoring subscriber behavior at STB 207 of Fig. 1B and reporting any interesting action which is considered significant (as disclosed in Col. 6 Lines 7-17). Link additionally teaches the use of Asset Viewer Ship Consolidator 214 operating in accordance with the method of Fig. 8 to combined the asset tag timestamp records 110 for the head end 301 with the STB aggregate data 109 to determine the

Art Unit: 2427

consumer behavior with regards to individual assets (as disclosed in Col. 10 Line 40—Col. 11 Line 39).

Both Aras and Link teach similar techniques and systems for monitoring and reporting user interaction with television content. Aras teaches monitoring and collecting data regarding users' interaction with VOD content, which is then sent to BCC 121 for processing in accordance with AVI data provided by Content and Network providers. Link additionally teaches Asset Viewer Ship Consolidator 214, operating in a similar fashion to BCC 121 of Aras, for the purpose of combining distributor and consumer data for the purpose of determining consumer behavior with regard to television content (in accordance with Fig. 8). Therefore, one of ordinary skill in the art at the time of the invention would have recognized that the functionality of BCC 121 of Aras and Asset Viewer Ship Consolidator 214 are usable together. Additionally, one of ordinary skill in the art would have been motivated to employ the "combining" and "consolidating" aspects of Link with the teachings of Aras in order to create a centralized representation of users' behavior with television content associated with data describing the content itself so that the data can be more efficiently interpreted (such as that shown in Fig. 9 of Link).

11. In regards to Claim 4, the combination of Aras and Link teaches a method as defined in Claim 1 wherein the server metering data comprises VOD content metadata (Aras demonstrates "Application Category" such as for identifying VOD content, as shown in Table II of Col. 10; with further reference to "Title", "Description", and "Rating"

Art Unit: 2427

of Table VI in Col. 11, as described in Col. 9 Line 17—Col. 10 Line 9 and Col. 26 Line 62—Col. 27 Line 4).

12. In regards to Claim 5, the combination of Aras and Link teaches a method as defined in Claim 1 wherein the server metering data comprises VOD content identification information (Aras demonstrates “Application Category” such as for identifying VOD content, as shown in Table II of Col. 10; with further reference to “Title”, “Description”, and “Rating” of Table VI in Col. 11, as described in Col. 9 Line 17—Col. 10 Line 9 and Col. 26 Line 62—Col. 27 Line 4).

13. In regards to Claim 7, the combination of Aras and Link teaches a method as defined in Claim 1 wherein the server metering data comprises a set-top box identifier associated with the first subscriber site (Aras discloses Home Station Identification Number 1401 and Subscriber Number 1403, as described in Col. 17 Lines 30-38, where Home Station can be a set-top box, as described in Col. 24 Lines 29-43; with further reference to “cost field”, as described in Col. 23 Lin 55—Col. 24 Line 26).

14. In regards to Claim 9, the combination of Aras and Link teaches a method as defined in Claim 1 wherein the server metering data comprises VOD server information (Network Provider ID of Table III of Col. 10, as described in Col. 9 Lines 17-29).

15. In regards to Claim 10, the combination of Aras and Link teaches a method as defined in Claim 9 wherein the VOD server information describes a status of a VOD session initiated between the VOD server and the first subscriber site (Aras teaches Command Capture for VOD, as described in Col. 23 Lines 27-54).

Art Unit: 2427

16. In regards to Claim 11, the combination of Aras and Link teaches a method as described in Claim 10 wherein the status of the VOD session corresponds to at least one of beginning the VOD session, ending the VOD session, providing informational status, starting a VOD stream during the VOD session, stopping a VOD stream during the VOD session, performing a navigation operation during the VOD session or performing a trickmode during the VOD session (Aras teaches tracking VOD navigation operations such as pause, rewind, slomo, and fast forward, as disclosed in Col. 23 Lines 27-38).

17. In regards to Claim 16, the combination of Aras and Link teaches a method as defined in Claim 1 wherein the subscriber metering data comprises VOD activity information (Aras teaches tracking VOD navigation operations such as pause, rewind, slomo, and fast forward, as disclosed in Col. 23 Lines 27-38; with further reference to additional user interactions described in Col. 13 Line 65—Col. 14 Line 24).

18. In regards to Claim 17, the combination of Aras and Link teaches a method as defined in Claim 16 wherein the VOD activity information comprises a VOD virtual channel selected to receive the VOD content (Aras teaches generation of event data based on a channel change by the subscriber, as described in Col. 14 Lines 1-24; with further reference to Fig. 6c, as described in Col. 34-57. Link additionally describes virtual channel numbers in Col. 11 Lines 2-4).

19. In regards to Claim 18, the combination of Aras and Link teaches a method as defined in Claim 1 wherein the subscriber metering data comprises VOD content identification information (Aras teaches VOD application the subscribers screen may

Art Unit: 2427

contain title, category of movie to be viewed, the rating, and the mode, as disclosed in Col. 23 Lines 55-66).

20. In regards to Claim 20, the combination of Aras and Link teaches a method as defined in Claim 1 wherein the subscriber metering data comprises VOD content metadata (Aras teaches VOD application the subscribers screen may contain title, category of movie to be viewed, the rating, and the mode, as disclosed in Col. 23 Lines 55-66).

21. In regards to Claim 21, the combination of Aras and Link teaches a method as defined in Claim 1 wherein the subscriber metering data comprises at least one of a public or private content identifier included in a data bit stream used to carry the VOD content (Aras teaches AVI information can be inserted as private data, as disclosed in Col. 13 Lines 44-46; with further reference to Col. 22 Lines 43-58).

22. In regards to Claim 22, the combination of Aras and Link teaches a method as defined in Claim 21 wherein the at least one of the public or private content identifier corresponds to at least one of an MPEG-2 data field or an AC3 data field (Aras teaches the private data is corresponds to an MPEG-2 transport stream, as disclosed in Col. 13 Lines 34-52).

23. In regards to Claim 23, the combination of Aras and Link teaches a method as defined in Claim 1 wherein the subscriber metering data comprises viewing information (Aras teaches a tracking a variety of subscriber interactions (i.e. "events") such as channel change and trick play operations, as described in Col. 14 Lines 8-24).

24. In regards to Claim 24, the combination of Aras and Link teaches a method as defined in Claim 23 wherein the viewing information comprises at least one of content codes or content signatures (Aras teaches monitoring of AVMs selected by the subscriber for presentation, as described in Col. 13 Lines 24-58).

25. In regards to Claim 25, the combination of Aras and Link teaches a method as defined in Claim 23 wherein the viewing information comprises an indicator corresponding to whether a subscriber viewing device is turned ON (Aras teaches Power Off Event, as described in Col. 16 Lines 34-51 and shown in Fig. 6e).

26. In regards to Claim 26, the combination of Aras and Link teaches a method as defined in Claim 23 wherein the viewing information corresponds to operating states associated with presenting the VOD content (Aras teaches a tracking a variety of subscriber interactions (i.e. "events") such as channel change and trick play operations, as described in Col. 14 Lines 8-24).

27. In regards to Claim 27, the combination of Aras and Link teaches a method as defined in Claim 26 wherein the operating states comprise at least one of a play state, a resume state, a mute state, a pause state, a rewind state or a fast-forward state (Aras teaches VOD interactions such as pause, rewind, slomo, and fast forward, as disclosed in Col. 23 Lines 27-38).

28. In regards to Claim 28, the combination of Aras and Link teaches a method as defined in Claim 1 wherein the subscriber metering data comprises subscriber identification information (Aras discloses Home Station Identification Number 1401 and Subscriber Number 1403, as described in Col. 17 Lines 30-38).

Art Unit: 2427

29. In regards to Claim 29, the combination of Aras and Link teaches a method as defined in Claim 28 wherein the subscriber identification information comprises at least one of a set-top box identifier, a VOD content order request or VOD billing information (Aras discloses Home Station Identification Number 1401 and Subscriber Number 1403, as described in Col. 17 Lines 30-38, where Home Station can be a set-top box, as described in Col. 24 Lines 29-43).

30. In regards to Claim 31, the combination of Aras and Link teaches a method as defined in Claim 1 wherein the subscriber metering data is stored in at least one viewing record (Aras teaches BCTs of Figs. 10-13 stored at Home Station, as described in Col. 20 Lines 15-33).

31. In regards to Claim 32, the combination of Aras and Link teaches a method as defined in Claim 31 wherein the viewing record comprises at least one of a home unit identifier or a set-top box identifier (Aras discloses Home Station Identification Number 1401 and Subscriber Number 1403, as described in Col. 17 Lines 30-38, where Home Station can be a set-top box, as described in Col. 24 Lines 29-43).

32. In regards to Claim 33, the combination of Aras and Link teaches a method as defined in Claim 31 wherein the subscriber metering data is timestamped (Aras teaches BCTs of Figs. 12 and 13 recording Start Times and End Times, as described in Col. 20 Lines 34-40).

33. In regards to Claim 37, the combination of Aras and Link teaches a method as defined in Claim 1 wherein combining the subscriber metering data and the server metering data comprises augmenting the subscriber metering data with at least selected

Art Unit: 2427

portions of the server metering data (Link teaches combination of asset timestamp records 110 for the head end 301 with the STB aggregated data 109, as described in Col. 10 Lines 51-65).

34. In regards to Claim 38, the combination of Aras and Link teaches a method as defined in Claim 1 wherein combining the subscriber metering data and the server metering data comprises projecting the server metering data onto the subscriber metering data based on statistical characteristics common to the subscriber metering data and the server metering data (Link teaches a process of matching channel line up data, published schedule data, and timestamp data, as shown in Fig. 8 and described in Col. 11-39. Aras additionally discloses the use of a subscriber profile, as described in Col. 24 Lines 11-26).

35. In regards to Claim 39, the combination of Aras and Link teaches a method as defined in Claim 1 wherein combining the subscriber metering data and the server metering data comprises projecting a plurality of subscriber metering data onto the server metering data based on statistical characteristics common to the plurality of subscriber metering data and the server metering data (Link teaches a process of matching channel line up data, published schedule data, and timestamp data, as shown in Fig. 8 and described in Col. 11-39. Aras additionally discloses the use of a subscriber profile, as described in Col. 24 Lines 11-26).

36. In regards to Claim 42, the combination of Aras and Link teaches a method as defined in claim 1 wherein combining the subscriber metering data and the server metering data comprises verifying the subscriber metering data based on the server

Art Unit: 2427

metering data (Link teaches verifying subscriber and headend data by way of Channel Line Up table, as described in Col. 11 Lines 25-36).

37. In regards to Claim 60, Aras teaches an article of manufacture storing machine readable instructions (operations of BCC 121 of Fig. 4A in accordance with Fig. 6, as introduced in Col. 14 Lines 25-43 and Col. 12 Lines 39-54; with further reference to Col. 6 Lines 1-28) that, when executed, cause a machine to:

determine server metering data corresponding to a video-on-demand (VOD) server configured to provide VOD content specifically to a first subscriber site in a plurality of subscriber sites (Audio-Visual Identifiers (AVIs), as introduced in Col. 7 Lines 31-67; with further reference to Content and Network related Extension Fields of Tables II and III, as described in Col. 9 Line 17—Col. 10 Line 7);

determine subscriber metering data corresponding to media content presented at the first subscriber site (“Behavior Collection & Reporting”, as introduced in Col. 13 Line 24—Col. 14 Lines 24 and shown in Fig. 6(i), as described in Col. 17 Line 23—Col. 18 Line 9; with further reference to Behavior Collection Table (BCT), as introduced in Col. 20 Lines 15-33 and shown in Figs. 10-13);

the subscriber metering data indicating whether the VOD content was selected for presentation at the first subscriber site, (VOD navigation operations such as pause, rewind, slomo, and fast forward, as disclosed in Col. 23 Lines 27-38) and

the server metering data identifying the VOD content provided by the VOD server specifically to the first subscriber site (AVI Content Extensions Fields (AVI-EC) including

Art Unit: 2427

information such as Content Type and Application Category, as shown in Table II of Col. 10 and described in Col. 9 Line 17—Col. 10 Line 8) and also identifying the first subscriber site (AVI Distribution Extension Fields (AVI-ED) included in the program stream by content and network providers, where the AVI-ED can be used to identify the zip code of a local distribution node, as described in Col. 9 Line 17—Col. 10 Line 8, Col. 13 Lines 7-23; with further reference to Table III in Col. 10).

Aras describes a method performed by Behavior Collection Center (BCC) 121 of Fig. 4a for taking information collected by various home stations and processing it for various marketing, broadcast planning, advertising, and Audio-Video Material (AVM) provider organizations (as disclosed in Col. 12 Lines 51-54). Aras additionally discloses in Col. 13 Lines 7-23 that the BCC 121 will collect, collate, analyze, and process the information so that it can be provided to various advertising agencies, marketing agencies, and AV material. However, Aras is unclear if the BCC 121 performs the operation to combine the subscriber metering data and the server metering data to monitor the VOD content provided specifically to the first subscriber site or if subscriber metering data does not identify the VOD content.

In a similar field of invention, Link discloses a system and method for capturing and reporting consumer behaviors concerning television use (Abstract, Fig. 1, and Fig. 8). Link discloses the use of Asset Code Server 202 of Fig. 1A for assigning a range of codes to an entity, such as a company or organization (as discussed in Col. 5 Lines 23-31). Link further discloses monitoring subscriber behavior at STB 207 of Fig. 1B and reporting any interesting action which is considered significant (as disclosed in Col. 6

Art Unit: 2427

Lines 7-17). Link additionally teaches the use of Asset Viewer Ship Consolidator 214 operating in accordance with the method of Fig. 8 to combined the asset tag timestamp records 110 for the head end 301 with the STB aggregate data 109 to determine the consumer behavior with regards to individual assets (as disclosed in Col. 10 Line 40—Col. 11 Line 39). Link also discloses that during the consolidation process, if program information is missing from the aggregated subscriber data then from the head end records is used to update the Viewership Consolidated Database 114 (as described in Col. 10 Line 43—Col. 11 Line 43).

Both Aras and Link teach similar techniques and systems for monitoring and reporting user interaction with television content. Aras teaches monitoring and collecting data regarding users' interaction with VOD content, which is then sent to BCC 121 for processing in accordance with AVI data provided by Content and Network providers. Link additionally teaches Asset Viewer Ship Consolidator 214, operating in a similar fashion to BCC 121 of Aras, for the purpose of combining distributor and consumer data for the purpose of determining consumer behavior with regard to television content (in accordance with Fig. 8). Therefore, one of ordinary skill in the art at the time of the invention would have recognized that the functionality of BCC 121 of Aras and Asset Viewer Ship Consolidator 214 are usable together. Additionally, one of ordinary skill in the art would have been motivated to employ the “combining” and “consolidating” aspects of Link with the teachings of Aras in order to create a centralized representation of users' behavior with television content associated with data describing

Art Unit: 2427

the content itself so that the data can be more efficiently interpreted (such as that shown in Fig. 9 of Link).

38. In regards to Claim 61, the combination of Aras and Link teaches an article of manufacture as defined in Claim 60 wherein the server metering data comprises at least one of VOD content metadata, VOD content identification information, subscriber identification information or VOD server information (Aras demonstrates “Application Category” such as for identifying VOD content, as shown in Table II of Col. 10; with further reference to “Title”, “Description”, and “Rating” of Table VI in Col. 11, as described in Col. 9 Line 17—Col. 10 Line 9 and Col. 26 Line 62—Col. 27 Line 4).

39. In regards to Claim 63, the combination of Aras and Link teaches an article of manufacture as defined in Claim 60 wherein the subscriber metering data comprises at least one of VOD activity information, VOD content identification information, VOD content metadata, viewing information, subscriber identification information or audience demographics (Aras teaches tracking VOD navigation operations such as pause, rewind, slomo, and fast forward, as disclosed in Col. 23 Lines 27-38; with further reference to additional user interactions described in Col. 13 Line 65—Col. 14 Line 24).

40. In regards to Claim 65, the combination of Aras and Link teaches an article of manufacture as defined in claim 60 wherein the machine readable instructions, when executed, cause the machine to combine the subscriber metering data and the server metering data by at least one of augmenting or verifying the subscriber metering data with at least selected portions of the server metering data (Link teaches a process of matching channel line up data, published schedule data, and timestamp data, as shown

in Fig. 8 and described in Col. 11-39. Aras additionally discloses the use of a subscriber profile, as described in Col. 24 Lines 11-26).

41. In regards to Claim 72, Aras teaches a system to monitor presentation of video-on-demand (VOD) content (operations of system of Fig. 4A for collecting data on behavior of subscribers to audio-visual materials such as VOD content, as introduced in Col. 6 Lines 32-54 and Col. 13 Line 24—Col. 14 Line 24; with further reference to Fig. 6, as introduced in Col. 14 Lines 25-43 and Col. 12 Lines 39-54), the system comprising:

a metering server interface to determine server metering data corresponding to a VOD server configured to provide the VOD content specifically to a first subscriber site in a plurality of subscriber sites (ITV Server 103 of Fig. 4A, as described in Col. 13 Lines 7-23; with further reference to Col. 4 Line 58—Col. 5 Line 4 for providing Audio-Visual Identifiers (AVIs), as introduced in Col. 7 Lines 31-67; with further reference to Content and Network related Extension Fields of Tables II and III, as described in Col. 9 Line 17—Col. 10 Line 7);

a metering home interface to determine subscriber metering data corresponding to media content presented at the first subscriber site (operations of Monitor 1555 of Home Station shown in Fig. 15 and further detailed in Figs. 16 and 17, as described in Col. 24 Line 56—Col. 25 Line 41 and Col. 25 Line 42—Col. 26 Line 32 for performing the process of “Behavior Collection & Reporting”, as introduced in Col. 13 Line 24--Col. 14 Lines 24 and shown in Fig. 6(i), as described in Col. 17 Line 23—Col. 18 Line 9; with

Art Unit: 2427

further reference to Behavior Collection Table (BCT), as introduced in Col. 20 Lines 15-33 and shown in Figs. 10-13); and

the first metering data included in the subscriber metering data indicating that VOD content was selected for presentation at the first subscriber (VOD navigation operations such as pause, rewind, slomo, and fast forward, as disclosed in Col. 23 Lines 27-38), and

the second metering data included in the server metering data identifying the VOD content provided by the VOD server specifically to the first subscriber site (AVI Content Extensions Fields (AVI-EC) including information such as Content Type and Application Category, as shown in Table II of Col. 10 and described in Col. 9 Line 17—Col. 10 Line 8) and also identifying the first subscriber site (AVI Distribution Extension Fields (AVI-ED) included in the program stream by content and network providers, where the AVI-ED can be used to identify the zip code of a local distribution node, as described in Col. 9 Line 17—Col. 10 Line 8, Col. 13 Lines 7-23; with further reference to Table III in Col. 10).

Aras describes a method performed by a central facility in the form of Behavior Collection Center (BCC) 121 of Fig. 4a for taking information collected by various home stations and processing it for various marketing, broadcast planning, advertising, and Audio-Video Material (AVM) provider organizations (as disclosed in Col. 12 Lines 51-54). Aras additionally discloses in Col. 13 Lines 7-23 that the BCC 121 will collect, collate, analyze, and process the information so that it can be provided to various advertising agencies, marketing agencies, and AV material. However, Aras is unclear if

Art Unit: 2427

the BCC 121 is used to combine the subscriber metering data and the server metering data by replacing first metering data included in the subscriber metering data with second metering data included in the server metering data to monitor the VOD content provided specifically to the first subscriber site or if subscriber metering data does not identify the VOD content.

In a similar field of invention, Link discloses a system and method for capturing and reporting consumer behaviors concerning television use (Abstract, Fig. 1, and Fig. 8). Link discloses the use of Asset Code Server 202 of Fig. 1A for assigning a range of codes to an entity, such as a company or organization (as discussed in Col. 5 Lines 23-31). Link further discloses monitoring subscriber behavior at STB 207 of Fig. 1B and reporting any interesting action which is considered significant (as disclosed in Col. 6 Lines 7-17). Link additionally teaches the use of Asset Viewer Ship Consolidator 214 operating in accordance with the method of Fig. 8 to combined the asset tag timestamp records 110 for the head end 301 with the STB aggregate data 109 to determine the consumer behavior with regards to individual assets (as disclosed in Col. 10 Line 40—Col. 11 Line 39). Link also discloses that during the consolidation process, if program information is missing from the aggregated subscriber data then from the head end records is used to update the Viewership Consolidated Database 114 (as described in Col. 10 Line 43—Col. 11 Line 43). Link's process of Figure 8 further includes the act of replacing subscriber metering data with server metering data by way of the updating process using elements 110-112 (as described in Col. 10 Line 43—Col. 11 Line 43)

Both Aras and Link teach similar techniques and systems for monitoring and reporting user interaction with television content. Aras teaches monitoring and collecting data regarding users' interaction with VOD content, which is then sent to BCC 121 for processing in accordance with AVI data provided by Content and Network providers. Link additionally teaches Asset Viewer Ship Consolidator 214, operating in a similar fashion to BCC 121 of Aras, for the purpose of combining distributor and consumer data for the purpose of determining consumer behavior with regard to television content (in accordance with Fig. 8). Therefore, one of ordinary skill in the art at the time of the invention would have recognized that the functionality of BCC 121 of Aras and Asset Viewer Ship Consolidator 214 are usable together. Additionally, one of ordinary skill in the art would have been motivated to employ the "combining" and "consolidating" aspects of Link with the teachings of Aras in order to create a centralized representation of users' behavior with television content associated with data describing the content itself so that the data can be more efficiently interpreted (such as that shown in Fig. 9 of Link).

42. In regards to Claim 74, the combination of Aras and Link teaches a system as defined in Claim 72 wherein the server metering data further comprises at least one of VOD content metadata or VOD server information (Aras demonstrates VOD content metadata in the form of "Application Category" such as for identifying VOD content, as shown in Table II of Col. 10; with further reference to "Title", "Description", and "Rating" of Table VI in Col. 11, as described in Col. 9 Line 17—Col. 10 Line 9 and Col. 26 Line 62—Col. 27 Line 4).

Art Unit: 2427

43. In regards to Claim 76, the combination of Aras and Link teaches a system as defined in claim 72 wherein the subscriber metering data comprises at least one of VOD activity information, viewing information, subscriber identification information or audience demographics (Aras teaches tracking VOD activity information and viewing information such as pause, rewind, slomo, and fast forward, as disclosed in Col. 23 Lines 27-38; with further reference to additional user interactions described in Col. 13 Line 65—Col. 14 Line 24).

44. In regards to Claim 78, the combination of Aras and Link teaches a system as defined in Claim 72 wherein the metering server interface comprises a back-channel monitor to monitor back-channel information received by a VOD service provider from the first subscriber site (Aras teaches “Reporting Process” of Fig. 4A; with further reference to Upstream Channel between the Home Station and the Video Distribution Node, as described in Col. 3 Lines 1-27 and transmission of BCT Table upstream, as described in Col. 17 Lines 10-56).

45. In regards to Claim 80, the combination of Aras and Link teaches a system as defined in Claim 72 wherein the metering server interface comprises a VOD server information generator to generate VOD server information to describe a status of a VOD session initiated between the VOD server and the first subscriber site (Aras teaches Command Capture for VOD, as described in Col. 23 Lines 27-54).

46. In regards to Claim 81, the combination of Aras and Link teaches a system as defined in Claim 80 wherein the status of the VOD session corresponds to at least one of beginning the VOD session, ending the VOD session, providing informational status,

Art Unit: 2427

starting a VOD stream during the VOD session, stopping a VOD stream during the VOD session, performing a navigation operation during the VOD session or performing a trickmode during the VOD session (Aras teaches tracking VOD navigation operations such as pause, rewind, slomo, and fast forward, as disclosed in Col. 23 Lines 27-38).

47. In regards to Claim 82, the combination of Aras and Link teaches a system as defined in Claim 72 wherein the metering home interface comprises a set-top box monitoring interface to monitor operation of a set-top box configured to receive the media content provided to the first subscriber site (Aras teaches Monitor 1555 of Home Station, such as a Set-top Box, shown in Fig. 15 and further detailed in Figs. 16 and 17, as described in Col. 24 Line 29—Col. 25 Line 41 and Col. 25 Line 42—Col. 26 Line 32).

48. In regards to Claim 95, the combination of Aras and Link teaches a system as defined in Claim 72 wherein the metering home interface comprises an on-screen display reader to process a display of a presentation device located at the subscriber site (Aras teaches Decode and Display Circuitry of Fig. 16, as described in Col. 24 Lines 29-34).

49. In regards to Claim 102, the combination of Aras and Link teaches a system as defined in Claim 72 wherein the metering home interface comprises a sniffer device to monitor at least one of back-channel communications or broadcast channel communications between a VOD service provider and the first subscriber site (Aras teaches AVI Decoder 1559 in conjunction with Monitor 1555 of Fig. 15 and further detailed in Fig. 17, as described in Col. 25 Line 64—Col. 26 Line 20).

Art Unit: 2427

50. In regards to Claim 107, the combination of Aras and Link teaches a system as defined in claim 72 further comprising a metadata tagger unit to include VOD content metadata in the VOD content (Aras teaches AVI encoding by head end, as described in Col. 11 Line 43--Col. 12 Line 38).

51. In regards to Claim 108, the combination of Aras and Link teaches a system as defined in claim 107 wherein the metering server interface comprises a metadata tag collector to collect metadata from at least one of the plurality of VOD content (Aras teaches operations of BCC 121, as described in Col. 12 Lines 39-64).

52. In regards to Claim 109, the combination of Aras and Link teaches a system as defined in claim 107 wherein the metering home interface comprises a metadata tag extractor to extract metadata from the selected VOD content (Aras teaches AVI Decoder 1559 of Fig. 15, as described in Col. 24 Line 44—Col. 25 Line 4).

53. In regards to Claim 110, the combination of Aras and Link teaches a system as defined in Claim 72 wherein the central facility is to select at least a portion of the server metering data based on the subscriber metering data (Link teaches the use of Head End and Virtual Channel Number to match a record in the asset timestamp 110, as described in Col. 11 Lines 21-24 and shown in Fig. 8).

54. In regards to Claim 111, the combination of Aras and Link teaches a system as defined in Claim 110 wherein the central facility is to select the portion of the server metering data based on a set-top box identifier included in the subscriber metering data (Link discloses STB ID database of Fig. 9, as described in Col. 11 Lines 10-46).

55. In regards to Claim 112, the combination of Aras and Link teaches a system as defined in Claim 111 wherein the central facility is to verify the subscriber metering data with the portion of the server metering data (Link teaches combination of asset timestamp records 110 for the head end 301 with the STB aggregated data 109, as described in Col. 10 Lines 51-65).

Conclusion

56. **THIS ACTION IS MADE FINAL.** Applicant is reminded of the extension of time policy as set forth in 37 CFR 1.136(a).

A shortened statutory period for reply to this final action is set to expire THREE MONTHS from the mailing date of this action. In the event a first reply is filed within TWO MONTHS of the mailing date of this final action and the advisory action is not mailed until after the end of the THREE-MONTH shortened statutory period, then the shortened statutory period will expire on the date the advisory action is mailed, and any extension fee pursuant to 37 CFR 1.136(a) will be calculated from the mailing date of the advisory action. In no event, however, will the statutory period for reply expire later than SIX MONTHS from the mailing date of this final action.

57. Any inquiry concerning this communication or earlier communications from the examiner should be directed to PATRICK A. RYAN whose telephone number is (571)270-5086. The examiner can normally be reached on Mon to Thur, 8:00am - 5:00pm EST.

Art Unit: 2427

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Scott Beliveau can be reached on (571) 272-7343. The fax phone number for the organization where this application or proceeding is assigned is 571-273-8300.
